

STOKES WOOD PRIMARY SCHOOL KEEPING ANIMALS IN SCHOOL POLICY April 2023

Stokes Wood Primary School recognises that the presence of animals in our school can provide a valuable learning experience about life processes, about caring for vulnerable living things which rely on pupils to feed and keep them safe and about building trusting relationships for our pupils. At the same time animals cannot be allowed to endanger student safety or disrupt learning. The wellbeing and care of the animal should be in its best interest.

INTRODUCTION

This summary details the basic health and safety issues associated with handling and keeping animals in schools.

HANDLING ANIMALS

If animals are handled, the most important issue is the maintenance of good hygiene. When handling animals pupils and adults should:

- not consume food or drink,
- cover any open cuts or abrasions on the exposed skin of hands and arms with waterproof adhesive dressings,
- wash hands with soap and water before and directly after handling animals.
- keep animals away from the face.

Careful handling of small mammals and other animals is most important; the animals should be restrained sufficiently so that, they cannot damage themselves or the handler.

Mammals should be handled daily if possible (unless breeding or nursing when they should be disturbed as little as possible). In this way they will normally become quite tame and accustomed to being handled.

Gloves should not normally be worn unless it is known that an animal for one reason or another is likely to bite or scratch. In this situation a pair of rubber gloves which does not particularly reduce dexterity, is a sensible precaution.

Handling small animals should always be carried out over a table or trough filled with a soft material such as sand / sawdust.

Physical injuries

There is always the danger of bites and scratches, and staff should check that any animals kept / brought in are docile, friendly and gentle in the presence of children. Small fingers poked towards the mouths of normally non-aggressive animals may be interpreted as an offering of food and obligingly bitten.

Diseases, parasites and allergies

The likelihood of diseases being passed on from pet animals is low. However allergic reactions to mammals, birds and a few other animals cannot be discounted. These might result from handling the animals or just from being near them and be detected by the development of skin rashes, irritation to the eyes and nose or breathing difficulties.

Hand washing soon after handling animals or after close contact with animals will help.

Teachers should watch for the development of allergic reactions in pupils who come into contact with the animals. Animals should have inoculations where appropriate.

Children known to have allergic reactions to specific animals must, of course, have restricted access to those that may trigger a response. In most cases, an allergic reaction will subside once the animal and the affected person are kept apart; in extreme cases, seek medical advice.

Salmonella bacteria may be carried by reptiles; good hygiene is again required, especially if aquatic reptiles, such as terrapins, are kept. Good general hygiene and hand washing are essential for risk reduction.

Children under five should not have contact with such reptiles or the environment in which the reptiles live or exercise.

BRINGING PETS AND OTHER ANIMALS INTO SCHOOL

In addition to the general guidance given above it is important that suitable arrangements are made in advance for the well-being of animals for the short time they are to be on the premises

If a variety of animals are in school, their interaction should be considered. Animals must be housed properly and separately whilst on the premises, any containers used to transport them must be appropriate and retain the animal securely.

ANIMAL SUPPLIERS

The majority of animals available through reputable suppliers present no hazards that good hygiene procedures cannot address.

In order for there to be minimal risk to humans of diseases being transmitted from animals kept in schools, it is important that animals are obtained from accredited or high-quality sources.

Unless these are known to have originated from a reliable source, it will not be possible to be confident that they are disease-free.

ANIMAL HEALTH

If animals are not kept in scrupulously clean conditions, or come into contact with other animals from dubious sources, it will no longer be possible to guarantee that the animals will remain in a disease-free condition.

Holiday times, particularly in primary schools, can obviously create real difficulties. If animals are taken out of school at holidays, they should not be sent home with pupils or other people unless all of the following considerations can be satisfied.

It can be guaranteed that the animals will be looked after as well as usual.

Whoever is caring for the animals must have all the necessary information, equipment, food, skills, etc.

- Parents must give their consent and collect the animals with the child.
- Steps will be taken to ensure that the school's animals will not be able to come into contact with pet animals (cats, dogs, rodents or other mammals).
- That small mammals cannot come into contact with wild rodents (mice, rats, etc) while off the school premises.

CLEANING AND HYGIENE

This is extremely important, both for the health of the animals and for those people looking after them. Hands should be washed *before* and, most importantly, after cleaning cages, tanks etc. Rubber or plastic gloves should be worn.

After removing soiled litter material, cages should be scrubbed with hot water and liquid detergent.

Frequency of cleaning (Small Mammals)

This should be done at least every 7 days.

Arrangements must be made for cages to be cleaned as regularly as normal at holiday times.

SOILED LITTER DISPOSAL

Soiled litter should be sealed in strong plastic bags and placed with other waste in dustbins.

UNSUITABLE ANIMALS

Certain animals present unacceptable risks and should not be brought into schools.

Wild birds and mammals taken, even if legally, from the 'wild' should not be brought into schools directly as they may be harbouring diseases or parasites transmissible to humans.
